Calcium deposits. Chest X-rays can detect the presence of calcium in your heart or blood vessels. Its presence may indicate damage to your heart valves, coronary arteries, heart muscle or the protective sac that surrounds the heart. Calcium deposits in your lungs are most often from an old, resolved infection.

Other findings of this work largely concur with early radiology investigative efforts insofar as this pattern of ground-glass and consolidative pulmonary opacities, often with a bilateral and peripheral lung distribution, is emerging as the chest CT hallmark of COVID-19 infection. This pattern of disease, somewhat similar to that described in earlier coronavirus outbreaks such as SARS and MERS, also dovetails with the blueprint thoracic radiologists recognize as the archetypal response to ...

Chest x-rays provide a good outline of the heart and major blood vessels and usually can reveal a serious disorder in the lungs, the adjacent spaces, or the chest wall, including the ribs. For example, chest x-rays can show most pneumonias, lung tumors, chronic obstructive pulmonary disease, a collapsed lung (atelectasis), and air (pneumothorax) or fluid (pleural effusion) in the pleural space.

There is little research to guide what to do when they pop up on an imaging report (as the famous dodge "clinical correlation needed"). Computed tomography (CT) of the chest (45%), CT colonoscopy (38%), and cardiac magnetic resonance imaging (MRI) (34%) commonly produce incidental findings.

**Incidental Findings Are Common with Chest CT and MRI of ...**  
Chest imaging includes use of plain x-rays, computed tomography (CT) scanning, magnetic resonance imaging (MRI), nuclear scanning, and ultrasonography. There are no absolute contraindications to undergoing noninvasive imaging procedures except for MRI. The presence of metallic objects in the patient's eye or brain precludes MRI.
