Design of multivariable feedback control systems will then be studied with the objective to satisfying performance specifications in frequency and time domains. Design tools such as frequency loop shaping and eigenvalue assignment will be developed which can be regarded as extension of Bode and root locus in classic control, respectively.

Feedback control design allows to influence a process with an undesirable transfer function by means of a controller such that the combined (i.e.,

controlled or closed-loop) system has a desirable transfer function.

### **Experiment 81 - Design of a Feedback Control System**

The first conscious use of feedback control of a physical system by mankind lives in. The goal can be accomplished by Laplace-transforming each differential equation and then generating a relationship, the transmittance, between the input and output of each block of the control system block diagram.
